

FoliXx Palace Platform

Unified Hospitality & Lifestyle Digital Platform

Project Codename	PALACE_OS
Version	1.0.0
Date	2025-05-27
Status	Approved for Prototype Development
Author	AI-Assisted (Claude Sonnet 4.6 + Developer .ai-system)
Brands	FoliXx Bukka · Secrets Palace (FoliXx Hospitality Group)

AI-Assisted Document Notice: This PRD was produced through iterative research and collaborative authoring with Claude AI (Anthropic), guided by live analysis of FoliXx Bukka and Secrets Palace digital presence, and structured per the developer's .ai-system metadata-driven architecture directives.

16. Glossary

1. EXECUTIVE SUMMARY

FoliXx Palace is a unified, metadata-driven digital platform serving two distinct but sibling hospitality brands under the **FoliXx Hospitality** umbrella:

- **FoliXx Bukka** — A Nigerian cuisine restaurant on the Lekki-Epe Expressway offering dine-in, takeaway, and delivery.
- **Secrets Palace** — Lagos's premier luxury nightclub operating Wednesday-Sunday, 10 PM-6 AM.

The platform consolidates brand presence, customer-facing experiences (ordering, reservations, table booking, event discovery), and operational back-office (analytics, CMS, inventory signals) into a single, beautifully designed application. It replaces fragmented third-party dependencies (OlaClick POS, WhatsApp ordering, static booking flows) with an owned, extensible system.

The platform is architected following a **metadata-driven, admin-configurable, OOP-based** development pattern — with hardcoded fallback configs — ensuring minimal hardcoding and maximum flexibility across sessions and environments.

2. BUSINESS CONTEXT & RESEARCH FINDINGS

2.1 FoliXx Bukka

Current State:

- Primary presence: folixxbukka.ola.click — third-party OlaClick digital menu with limited customisation.
- Companion app (app.folixxbukka.com): minimal interface with hero section but no functional ordering.
- Ordering is WhatsApp-forwarded — creating friction and untracked conversions.
- Services: Dine-in, Takeaway, Delivery (12-35 min). Location: 142 Lekki-Epe Expressway, Lagos.

Identified Gaps:

Gap	Impact
No native online ordering with payment processing	Revenue leakage via WhatsApp drop-offs
No loyalty or rewards system	Zero repeat-purchase incentive mechanism
No customer data capture	No CRM, emails, preference history
No real-time order tracking	Reduced customer trust and satisfaction
No admin dashboard	Blind spot on orders, revenue, and menu performance

2.2 Secrets Palace

- Operates Wed-Sun, 10 PM-6 AM. Peak activity: 3-5 AM.
- 116K+ Instagram followers; strong social and cultural brand credibility in Lagos.
- Revenue: bottle service, table reservations, entry, SPOB (Wednesday open bar events).
- Audience: millennials, Gen Z, celebrities, influencers, high-net-worth individuals.
- Differentiation: royal treatment framing, no hidden charges, world-class entertainment.
- Reservations via WhatsApp chatbot — no structured digital booking system.

Identified Gaps:

Gap	Impact
No structured online table booking with seat selection	Missed advance booking revenue

Gap	Impact
No event calendar or RSVP system	Marketing reach not converted to tracked attendance
No VIP tier or loyalty programme	No mechanism to reward top-spend customers
No digital menu / drinks catalogue	Pricing opacity creates friction
No analytics on spend or frequency	Zero data-driven operational decisions

3. PROBLEM STATEMENT

FoliXx Hospitality runs two flagship venues with strong brand equity but operates with fragmented, third-party-dependent digital infrastructure that:

- **Leaks revenue** — untracked WhatsApp conversions, no native payment rails.
- **Loses customer data** — no CRM, no email capture, no behavioural intelligence.
- **Limits brand control** — OlaClick/WhatsApp UX doesn't reflect luxury brand identity.
- **Creates operational blind spots** — no real-time dashboard for orders, reservations, or revenue.
- **Prevents loyalty building** — no mechanism to reward repeat customers.
- **Misses marketing leverage** — no event-driven push notifications, no targeted campaigns.

4. PRODUCT VISION & GOALS

Vision: "One platform. Two worlds. A seamless digital experience as premium as the venues themselves."

Strategic Goals

ID	Goal	Business Outcome
G1	Centralise customer journeys for both brands	Unified identity, cross-sell opportunities
G2	Enable native online ordering (Bukka)	Reduce WhatsApp friction, capture payment data
G3	Enable structured reservations (Secrets)	Increase advance booking rate, reduce no-shows
G4	Build owned customer data layer	Drive CRM, segmentation, personalisation
G5	Provide real-time analytics dashboard	Operational visibility, revenue intelligence
G6	Empower admins to configure content without code	Reduce TTM for menu/event updates
G7	Establish a loyalty & rewards framework	Increase retention and repeat visits

5. USER PERSONAS

The Bukka Regular — Chisom, 28

Lagos professional who orders lunch frequently. Currently uses WhatsApp; wants a native app. Values speed, accuracy, and delivery tracking. Motivated by loyalty points.

The Secrets Loyalist — Emeka, 32

High-income entrepreneur visiting Secrets 2-3x/month. Books tables for group outings. Expects VIP recognition, pre-orders preferred bottles, wants event calendar visibility.

The Special Occasion Guest — Adaeze, 25

Plans birthday dinner at Bukka + afterparty at Secrets. Discovers via Instagram. Needs seamless booking for both; values pricing transparency.

The Venue Admin — Operations Manager

Manages menus, pricing, bookings, promotions across both brands. Needs a single dashboard for real-time sales data, booking reports, and customer insights.

The Brand Marketer — Marketing Lead

Manages event campaigns for SPOB and special nights. Publishes events, manages guest lists, tracks campaign conversion from RSVP to attendance.

6. FUNCTIONAL REQUIREMENTS

6.1 Core Platform

ID	Requirement	Priority
F-01	Multi-brand routing: brand-specific experience by URL or selection	Must Have
F-02	Shared authentication layer (single account, multiple brand contexts)	Must Have
F-03	Metadata-driven brand config: colours, fonts, copy, images from CMS	Must Have
F-04	Responsive design: desktop, tablet, mobile-first	Must Have
F-05	Dark mode default (Secrets) / light mode default (Bukka); toggleable	Must Have
F-06	PWA capability: installable, offline-capable for menu browsing	Should Have

6.2 FoliXx Bukka — Ordering System

ID	Requirement	Priority
B-01	Dynamic menu with categories, items, images, pricing from CMS	Must Have
B-02	Cart with quantity control, item notes, and upsells	Must Have
B-03	Order type: Delivery, Takeaway, Dine-in	Must Have
B-04	Address input and delivery fee calculation	Must Have
B-05	Payment: card, bank transfer, USSD (Paystack/Flutterwave)	Must Have
B-06	Order confirmation with estimated delivery time	Must Have
B-07	Real-time order status tracking	Should Have
B-08	Order history with re-order functionality	Should Have
B-09	Meal scheduling: pre-order for future time	Could Have
B-10	Group ordering: share a cart link	Could Have

6.3 Secrets Palace — Reservation & Events

ID	Requirement	Priority
S-01	Table/area selection with visual floor map	Must Have
S-02	Reservation date, time, and group size selection	Must Have
S-03	Bottle/drinks pre-order at booking time	Must Have
S-04	Event calendar with RSVP/ticket purchase	Must Have
S-05	VIP package tiers with configurable perks	Must Have
S-06	Reservation confirmation via email + SMS	Must Have
S-07	Waitlist for fully booked nights	Should Have
S-08	Dress code and entry policy display	Must Have

ID	Requirement	Priority
S-09	Guest list management per event	Should Have
S-10	Live event feed / Tonight at Secrets section	Should Have

6.4 Loyalty & Rewards

ID	Requirement	Priority
L-01	Points accrual on Bukka orders and Secrets spend	Must Have
L-02	Tier system: Bronze, Silver, Gold, Royal	Must Have
L-03	Rewards catalogue: free items, discounts, VIP upgrades	Must Have
L-04	Points balance and history on user profile	Must Have
L-05	Referral programme with tracked referral codes	Should Have

7. NON-FUNCTIONAL REQUIREMENTS

Category	Requirement
Performance	Page load < 2.5s on 3G; Time to Interactive < 4s
Availability	99.5% uptime SLA; maintenance windows 6-9 AM WAT
Security	HTTPS enforced; JWT auth; PCI-DSS compliant via payment gateway
Scalability	Horizontal scaling; event nights may spike 10x normal traffic
Accessibility	WCAG 2.1 AA compliance
SEO	SSR/SSG for public pages; JSON-LD structured data (menus, events)
Data Privacy	NDPR (Nigeria Data Protection Regulation) compliant; explicit consent
Internationalisation	English primary; NGN currency; Nigerian phone number formats

8. FEATURE SPECIFICATIONS (KEY ARCHITECTURE POINTS)

8.1 Menu Architecture (Bukka) — Metadata-Driven

The menu is entirely metadata-driven. A MenuConfig object in the CMS defines: categories, items (with id, name, description, price, image, tags, dietary, available), modifier groups (e.g. spice level, protein choice), time-based availability rules, featured items, and upsell rules. No menu item is hardcoded in UI components.

8.2 Floor Map (Secrets Palace) — Config-Driven SVG

Tables and zones are defined in a VenueConfig JSON. The SVG floor map is rendered dynamically from this config, with available/reserved/selected states driven entirely by fetched data. Zone labels, table capacity, minimum spend, and VVIP flags are all admin-configurable properties.

8.3 Loyalty Engine — Rule-Driven Points System

Points earn rules, tier thresholds, and rewards are all admin-configurable via LoyaltyConfig. Tiers: Bronze (0-499), Silver (500-1999), Gold (2000-4999), Royal (5000+). Points expiry configurable per inactivity window.

9. ANALYTICS & DATA INTELLIGENCE

Customer Analytics: CLV per brand, RFM segmentation (recency/frequency/monetary), cohort analysis, cross-brand identification

Revenue Analytics: Daily/weekly/monthly GMV by brand and category, average order value trends, promo ROI

Operational Analytics: Order fulfilment times (Bukka), booking conversion funnel (Secrets), peak hour heatmaps, table occupancy

Marketing Analytics: Event RSVP-to-attendance conversion, notification open/CTR rates, referral performance

Dashboard Roles:

Role	Dashboard Access
Super Admin	All metrics across both brands
Bukka Manager	Bukka-specific order and revenue data only
Secrets Manager	Reservation, event, and bottle service data only
Marketer	Campaign performance and customer segments only

10. ADMIN & CONFIGURATION SYSTEM

All platform content is managed through a Super Admin Panel — no direct database edits or code changes required for content updates.

- Brand Config — logos, colours, typography, hero content per brand
- Menu Manager (Bukka) — CRUD for categories, items, modifiers, availability
- Venue Manager (Secrets) — table config, zone config, pricing rules
- Events Manager (Secrets) — create/edit events, performers, ticket types
- Loyalty Manager — configure earn rules, tiers, rewards, expiry
- Promotions Manager — discount codes, flash sales, bundle offers
- User Manager — view/search customers, adjust loyalty points
- Notification Templates — configurable email/SMS/push with variable placeholders

Hardcoded Fallback Pattern: Every configurable item has a typed hardcoded default exported from config/defaults/. If the CMS returns null or a network error occurs, the UI falls back to these defaults gracefully — no blank screens or broken layouts.

11. TECHNOLOGY STACK

Layer	Technology	Rationale
Frontend	Next.js 14 (App Router)	SSR/SSG, PWA, excellent DX
Styling	Tailwind CSS + CSS Variables	Design token system, rapid iteration
State	Zustand + React Query	Lightweight global state + server state sync
Database	PostgreSQL via Supabase	Relational, JSONB for metadata configs
Auth	Supabase Auth (JWT + OAuth)	Email, phone, Google sign-in
Payments	Paystack	Nigeria-first, robust, PCI compliant
Storage	Supabase Storage / Cloudinary	Image uploads for menu, events
Notifications	Resend + Termii + FCM	Email + Nigerian SMS + push
Analytics	Custom + PostHog	Event tracking, funnels, heatmaps
Charts	Recharts / Nivo	Flexible, accessible data visualisation
Deployment	Vercel + Railway/Render	Zero-config CI/CD
Monitoring	Sentry	Error tracking

12. METADATA-DRIVEN ARCHITECTURE OVERVIEW

The application follows a Metadata-First pattern where:

- **Config objects** (stored in DB, fetched at boot) drive all rendering logic.
- **UI components** are generic and receive config props — no component knows about specific menu items, table layouts, or event structures by name.
- **Admin Panel** is the single interface for mutating all config objects.
- **Hardcoded fallbacks** in config/defaults.ts ensure the app never fails to render.
- **OOP class models** define entity shapes shared between frontend types, API validation (Zod), and DB models.

AppConfig (fetched at boot) ■■■■ BrandConfig[] (FolixxBukka, SecretsPalace) ■■■■ MenuConfig (Bukka) ■■■■ VenueConfig (Secrets) ■■■■ LoyaltyConfig (shared) ■■■■ NotificationConfig (shared) ■■■■ AnalyticsConfig (per role)

13. CONSTRAINTS & ASSUMPTIONS

- **Constraint:** Project is a prototype — payment processing in Paystack test/sandbox mode.
- **Constraint:** Real-time order tracking uses mock state machine (WebSocket-ready, no live kitchen integration).
- **Assumption:** Both brands are under one corporate entity consenting to a unified data layer.
- **Assumption:** Nigerian mobile numbers (0XX format) are primary customer identifiers.
- **Assumption:** NGN (₦) is the sole currency.
- **Constraint:** AI-system directives must be embedded in project repo as /.ai-system/ directory.

14. SUCCESS METRICS

Metric	Target
Bukka online orders as % of total	> 40% within 3 months
Secrets reservations via platform	> 60% of total bookings
User registration rate	> 70% of ordering customers
Loyalty programme enrolment	> 50% of registered users
Admin config changes via dashboard	100% of content changes (no code)
Analytics dashboard daily active use	> 80% of ops staff
App load time (mobile 3G)	< 2.5 seconds

15. OUT OF SCOPE (v1)

- The Glass House integration (Phase 2)
- Native iOS/Android apps (PWA covers mobile in v1)
- Third-party delivery platform integration (Glovo, Chowdeck)
- Kitchen Display System (KDS) for restaurant staff
- Multi-currency or international expansion
- AI-powered personalised menu recommendations (Phase 2)
- Live streaming of events within the platform

16. GLOSSARY

Term	Definition
PALACE_OS	Internal project codename for the unified FoliXx Hospitality platform
Metadata-Driven	UI rendering controlled by config objects, not hardcoded values
Admin-Configurable	Any content change doable via admin panel without code deployment
SPOB	Secrets Palace Open Bar — Wednesday open bar event
VIP/VVIP	Tiered table categories at Secrets Palace
.ai-system	Developer's AI compliance and project continuity directive system
OOP	Object-Oriented Programming pattern applied to entity models
Hardcoded Fallback	Static defaults ensuring graceful degradation when CMS is unavailable
RFM	Recency, Frequency, Monetary — customer segmentation model
WAT	West Africa Time (UTC+1)
NDPR	Nigeria Data Protection Regulation
